Wheel building is essentially the same for front and rear wheels. There are the same number of steps and you'll drop the same number of spokes at the same time for both front and rear. Take the number of spokes for your wheel that you're building and divide by four - that will be the number of spokes you will set in each flange at any one given time.

Tension was my only concern, but I just used all of my other wheels as a guide with a squish test. It was my first time building wheels and I can't say I really had issues, they're pretty true, and I haven't demolished them yet after one singletrack ride and all of the cross races this year. The main thing is just go slow and a little at a time.

Sheldon Brown has a good succinct guide to wheel building. I started building wheels about 10 years ago and in all that time have never popped a spoke on any of my wheels nor have I ever needed to tinker with them. All you need is a jig, dishing tool and spoke key. You could use a frame, but a jig will make it easier.
